Front Panel

The front panel of the SL-6 has the following features:

<table>
<thead>
<tr>
<th>FEATURE</th>
<th>DESCRIPTION</th>
</tr>
</thead>
<tbody>
<tr>
<td>Receiver Slots</td>
<td>Each slot accepts one (single- or dual-channel) SuperSlot or unislot receiver. The connection provides power to the receiver and connects the receiver’s audio output directly to the 688.</td>
</tr>
<tr>
<td>Antenna Distribution leads</td>
<td>SMA connectors with right-angle adapters are used to connect receivers to the SL-6 antenna distribution system.</td>
</tr>
<tr>
<td>Antenna Connectors</td>
<td>BNC connectors are used for attaching external antennas to the SL-6 antenna distribution system.</td>
</tr>
</tbody>
</table>

![Antenna Connectors and Receiver Slots Diagram]

1 Use BNC to SMA adapters, included with the SL-6, for antennas with SMA connectors.
Right Panel

The right panel of the SL-6 has the following features:

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hirose 4-pin DC Input</td>
<td>Hirose 4-pin DC input for powering the SL-6 and 688. Power must be attached to this connector or an NP-1 battery must be inserted to power the SL-6 and 688.</td>
</tr>
<tr>
<td>Coaxial DC Outputs (12 V Isolated)</td>
<td>Isolated 12 V DC outputs that draw from the active SL-6 power source (Hirose 4-pin or NP-1). Each output is on by default but can be switched off from the POWER section of the Main menu.</td>
</tr>
<tr>
<td>Coaxial DC Outputs (12 V)</td>
<td>12 V DC outputs that draw from the active SL-6 power source (Hirose 4-pin or NP-1). Each output is on by default but can be switched off from the POWER section of the Main menu.</td>
</tr>
<tr>
<td>USB Charging Port</td>
<td>Standard USB 5 V DC output that draws from the active SL-6 power source (Hirose 4-pin or NP-1).</td>
</tr>
</tbody>
</table>

1. The USB port on the SL-6 is designed for charging only, not for data transfer.

Left Panel

The left panel of the SL-6 provides the NP-1 battery compartment, which accepts NP-1 batteries (14 V, Li-ion or NiMH).

To insert an NP-1 battery:

1. Pull the retainer tab out until it clicks. It will stop when protruding about 1 inch from the unit.
2. Place the end of the NP-1 battery with the metal contacts into the battery compartment with contacts facing down.
3. Push the NP-1 battery into the battery compartment until the retainer tab securely snaps over the end of the battery.
Powering with the SL-6

The SL-6 features two power inputs: NP-1 battery and external DC. The SL-6, its attached receivers, the 688 (and CL-6, if connected), and any devices powered from the SL-6 DC outputs require one of these power sources to operate. When both SL-6 power sources are depleted or disconnected, the SL-6 PowerSafe™ battery will keep the SL-6 and attached devices powered for 10 seconds while recording is stopped. If any power source is attached to the 688’s external DC input, or if internal AA batteries are present, the 688 (and CL-6, if attached) will continue to operate using those power sources.

1. **Power sources connected directly to the 688 (external DC or the internal AA batteries) will not power the SL-6 or any attached peripheral devices.**

When the SL-6 is attached, the DC voltage indicator (battery icon) on the 688’s Main screen will display NP or SL to indicate which power source is active.

1. **The color, which could also appear red (critical) or orange (low voltage), indicates a source’s power level.**
Power Screen

When the SL-6 is attached to the 688, the mixer’s Power screen displays the voltage level of the attached NP-1 battery, the SL-6 external DC power source, and the SL-6 PowerSafe battery, in addition to the 688’s own power sources.

SL-6 DC Outputs

The SL-6 right panel features four DC power outputs via locking coaxial connectors (numbered 1 through 4) and a USB charging port. Outputs 1 through 4 are 12 V DC outputs that draw from the active SL-6 power source. Outputs 1 and 2 are isolated and do not share a common ground with the system.

To turn a DC output on or off:

1. Press the MENU button to access the Main menu.
2. Turn and press the Headphone encoder to select POWER > SL-6 Power Outputs.
3. Turn and press the Headphone encoder to select an output and set it to On or Off.

To protect NP-1 batteries from exceeding their maximum discharge current, when total power draw reaches 45 watts, the 688 displays a warning message. When total power draw reaches 50 watts (SWIT battery) or 53 watts (IDX battery), the DC outputs will be turned off in descending order (output 4 - 1) until power draw drops below 45 watts. First the USB charging port will be disabled, then DC Output 4, DC Output 3, DC Output 2, and finally DC Output 1. You can manually turn outputs back on when power draw drops below 45 watts.

SL-6 Power Settings

When the SL-6 is attached, the following settings are available in the Main menu’s POWER section.

<table>
<thead>
<tr>
<th>Sub-Menu Name</th>
<th>Description</th>
<th>Options</th>
</tr>
</thead>
<tbody>
<tr>
<td>SL-6 Primary Source</td>
<td>Selects primary power source.</td>
<td>• NP-1</td>
</tr>
<tr>

• Output 4 (Battery)  
• USB Charging Port |

### Turning Off Power to Rx Slots

When the SL-6 is attached, the 688 provides a sub-menu option that lets users power off unused receiver slots in the SL-6.

> Sound Devices recommends that you do not manually power on/off receivers, or change output type/level, from the Rx interface when connected to the SL-6 as this may affect optimal performance of the 688/SL-6.

**To power on or off Rx slots 1-3 in an SL-6:**

1. Press MENU.
3. Select Slot 1, 2 or 3. Options include On or Off. By default, all slots are powered on.

> The Receiver Slot Power settings are not stored as part of factory defaults or custom configurations saved in Quick Setup files.

### Using Antenna Distribution

Two BNC antenna connections (A and B) are provided for attaching antennas to the antenna distribution system. Antennas with an SMA connection may be used with a BNC to SMA adapter, which is included with the SL-6.
The antennas on the SL-6 provide improved diversity performance due to wider spacing than those directly mounted on the receivers. This can reduce the instances of signal dropouts due to destructive cancellation of reflecting RF signals.

Good performance will be obtained when antennas are mounted directly to the SL-6 BNC connectors. Quarter wave whip antennas are typically used in this scenario with the SL-6 housing providing the reference plane.

Better performance will usually be observed with a higher elevation of the receive antenna. This can provide a more direct line of sight to the transmitter which improves signal strength. Shoulder mounted antennas are one example. Care should be used with antenna selection in this scenario. Some antennas, such as quarter wave (also known as quarter wave whip antennas), require a ground plane (metallic reflective surface usually perpendicular to the antenna). Others, such as a half wave antenna and log periodic antenna (Also referred to as paddle antenna), can be remotely mounted and do not require a ground plane.

For best performance, Sound Devices recommends directional remote antennas. Independent 12 volt antenna bias for powering active antennas is provided at each SL-6 antenna BNC connector.

Many variables are involved with a successful RF link. As such, results for each operation may vary.

**Antenna Bias Power**

If needed, 12V bias power may be provided to each antenna.

**To supply bias power to an antenna:**

1. Press the MENU button to access the Main menu.
2. Do one of the following:
   - Turn and press the Headphone encoder to select SL-6 > Antenna A Power.
   - Turn and press the Headphone encoder to select SL-6 > Antenna B Power.
3. Turn and press the Headphone encoder to turn bias power on or off.

**Radio Frequency (RF) Filter**

The SL-6 provides RF filtering which can allow operation in the presence of interfering signals such as cell phones and TV stations. Selection is provided for four different frequency ranges of operation.

**To enable the RF filter:**

1. Press the MENU button to access the Main menu.
2. Turn and press the Headphone encoder to select SL-6 > Antenna Filter.
3. Turn and press the Headphone encoder to select a filter range.
   Options include: Wideband, 470-700 MHz, 470-590 MHz, and 580-700 MHz. 
   Wideband represents the guaranteed range of operation of an SL-6. Signals above and below these frequencies may be usable. Filter selection depends on the presence and magnitude of interfering signals. Generally, the narrowest filter setting will give the best performance.

Using Wireless Receivers

The SL-6 supports SuperSlot and unislot receivers on a DB-25 connection. The SL-6 receiver slots provide power and audio connection to both types of receivers. Additionally, SuperSlot receivers can be controlled from the 688 interface.

To connect antennas to the SL-6:

- Connect each antenna directly to each BNC Antenna Connector on the SL-6.

To connect a receiver to the SL-6:

1. Power off the 688.
2. The SL-6 ships with rubber slot protectors that hold the SMA antenna connectors with right-angle adapters secure during transport. These must be removed prior to use, so remove the connector, then pull the rubber cover off to expose the chosen slot.
   - Do not discard protectors; Sound Devices recommends storing the connectors with their right-angle adapters in the rubber slot protectors when not in use.
3. Slide the receiver into slot on the SL-6. If necessary, use the provided spacer.
4. Screw the four mounting screws through the receiver and into the SL-6.
   - Use only the screws provided with the receiver. Longer screws can damage the SL-6.
5. Attach each antenna distribution lead to the receiver by screwing the SMA connector on both sides of the receiver.
Selecting a Wireless Source

SL-6 wireless receiver outputs are routed to 688 inputs via the SL-6 Routing screen. One wireless receiver output can be routed to one 688 input.

To route a receiver to an input:

1. Slide the PFL switch to access the Input Settings screen for the respective input.
2. Press the Headphone encoder to display the list of available input sources.
3. Turn and press the Headphone encoder to select SL-6. The SL-6 Routing screen is displayed. Wireless receiver outputs are represented as rows and 688 inputs are represented as columns. Blue boxes indicate active assignments.

4. Do any of the following:
   - Turn the Select encoder to move the orange highlight vertically and press the encoder to activate or deactivate the route.
   - Turn the Headphone encoder to move the orange highlight horizontally and press the encoder to activate or deactivate the route.

When a wireless receiver output is routed to a 688 input, that channel’s input source is set to SL-6. When a wireless receiver output is not routed from a 688 input, that channel’s input source is set to OFF.

Accessing the Receiver Overview Screen

The Receiver Overview screen displays summary information for all receivers connected to the SL-6. Information on this screen is read-only.

To access the Receiver Overview screen via button shortcut:

- HP + METERS: Press the Headphone encoder, then press the METERS button.

To access the Receiver Overview screen from the Main menu:

1. Press the MENU button.
2. Turn and press the Headphone encoder to select SL-6 > Receiver Overview.
When supported by the transmitter, the transmitter battery level is indicated by the color of the battery icon: Green = over 50%, Yellow = over 20%, Orange = over 10%, Red = less than 10%. Whenever the transmitter battery level information is not supported by the transmitter, the icon is black.

**Unislot Receivers**

Configuration of unislot receivers is done on the receivers themselves, not from the 688; therefore, the Receiver Details screen is not available for unislot receivers.

**Using SuperSlot Receivers**

When the 688 is powered on, the SL-6 will power receivers automatically; attached SuperSlot receivers will boot up with their panel buttons locked, because SuperSlot receivers are configured from the 688 user interface.

1. *Sound Devices recommends, if the 688 is powered on, you do not power down attached SuperSlot receivers. If SuperSlot receivers are powered down manually (by unlocking the receivers’ front panel buttons), the receivers will not be recognized until they are powered on manually and the 688 is rebooted.*

Detailed information for each attached SuperSlot receiver is displayed on the 688 via a Receiver Details screen. Adjustments to SuperSlot receivers may be made from this screen, including RF scanning and frequency assignment. See *Scanning for Radio Frequencies* for more information.

The screen’s title will show the type or model of the receiver. Based on your receiver, information on screen could vary; refer to the receiver manufacturer’s documentation provided with your receiver(s) for more information.

**To access Receiver Details screens from the Receiver Overview screen:**

1. METERS + HP: Press the METERS button, then push in the Headphone en-
coder to access the Receiver Overview screen.

2. Turn and press the Headphone encoder to select a receiver.

**To directly access a specific Receiver Details screen:**

- HP + PFL (1-6): Press and hold the Headphone encoder, and then slide the PFL switch that corresponds to the receiver number and channel you want to view—left for even channels and right for odd channels.

  For instance, to view the Receiver Details screen for channel 1 on the first slotted receiver, slide PFL 1 to the left. Slide the same switch right for channel 2 on the first slotted receiver.

  \(\text{This HP + PFL (1-6) shortcut bypasses the Receiver Overview screen that shows data for all slotted receivers.}\)

Receiver tuning is presented uniquely, based on each manufacturer’s receiver model. Current tuning values are displayed in outlined boxes on the Receiver Details screen.

**To adjust a receiver’s tuning:**

1. Access the Receiver Details screen.

2. Turn and press the Headphone encoder to enter editing mode for the selected field. The background color of the field will become blue to indicate editing mode.

3. Turn the Headphone encoder to adjust the value.

4. Press the Headphone encoder to accept the value.

For more information regarding Receiver Details screens, see Receiver Details Screen - Example A, Receiver Details Screen - Example B, and Receiver Details Screen - Example C.

**Automatic Receiver Output Setup**

When using SuperSlot receivers with the SL-6, some receiver settings are automatically set by the mixer for optimized performance.

These settings include:

<table>
<thead>
<tr>
<th>RECEIVER</th>
<th>SETTING</th>
<th>DESCRIPTION</th>
</tr>
</thead>
<tbody>
<tr>
<td>Lectrosonics SRb &amp;</td>
<td>SETUP &gt; LEVEL = -6</td>
<td>To achieve optimal audio level and to match the SRb or SRc output to the mixer’s input stage for best dynamic range, the 688 automatically sets the SRb or SRc’s gain level to -6, and the phase to +. There is no reason to manually set the SRb or SRc to any other level. Use the 688’s trim control to make any necessary adjustments.</td>
</tr>
<tr>
<td>Lectrosonics SRc</td>
<td>SETUP &gt; PHASE = +</td>

<td></td>
</tr>
</tbody>
</table>

### Receiver Details Screen - Example A

Information provided on the Receiver Details screen depends on your receiver model. This guide provides a couple of examples.

The following example of the Receiver Details screen is for a Lectrosonics SRc. Refer to Lectrosonics documentation for further explanation of these settings.

1. **This section applies to Lectrosonics SuperSlot-based receivers or those upgraded to SuperSlot. Earlier versions without the SuperSlot upgrade are treated as unislot receivers; therefore, the Receiver Details screen is not be accessible.**

#### Screen Element Description

<table>
<thead>
<tr>
<th>Screen Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>Screen’s title displays the number of the receiver followed by the manufacturer and model name.</td>
</tr>
<tr>
<td>Pilot tone status</td>
<td>Different letters are displayed based on status of pilot tone.</td>
</tr>
<tr>
<td>RF signal strength</td>
<td>Displays the strength of the RF signal.</td>
</tr>
<tr>
<td>Antenna phase</td>
<td>The antenna icon is displayed when Diversity mode is set to Switch. Icon will flip vertically when antenna phase is inverted.</td>
</tr>
<tr>
<td>Transmitter battery level</td>
<td>Displays the level of the transmitter’s battery. The transmitter battery level is indicated by the color of the battery icon and the level of the bar. Green = over 50%, Yellow = over 20%, Orange = over 10%, Red = less than 10%. When the transmitter battery level information is not supported, the icon is black.</td>
</tr>
</tbody>
</table>

1. **This information is only provided when supported and supplied by the transmitter.**
<table>
<thead>
<tr>
<th>Screen Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RF Scan</td>
<td>Runs a scan of the Lectrosonics receiver’s RF block or band, and then displays the frequency graph, allowing users to assign a frequency to the receiver’s channels.</td>
</tr>
</tbody>
</table>
|                         | **To assign a frequency:**
|                         | ▶ Use the Headphone encoder to scroll the graph; press it in to select and assign a frequency.                                           |
| IR Sync                 | Puts the receiver into IR Sync mode directly from the 688, enabling synchronization of the transmitter frequency to the Rx frequency.    |
|                         | **To initiate IR sync:**
|                         | ▶ Slide the MIC/TONE switch to the right and confirm by selecting OK when prompted. A status dialog appears while syncing is in progress. |
| 688 channel information | Displays the name and number of the 688 channel to which the receiver is routed.                                                                |
| Band                    | Displays the Lectrosonics SRc’s band.                                                                                                        |
|                         | † This does not apply to SRb receivers.                                                                                                       |
| Pre-fade level          | Displays pre-fade audio level of the receiver’s output on the 688 input to which it is routed.                                               |
| Frequency               | Displays the frequency to which the SRb or SRc is currently tuned. Whole number and decimal number are adjusted independently.            |
|                         | On the SRb, decimal adjustments are in .1 (Normal tuning) or .025 increments (Fine tuning).                                                   |
|                         | On the SRc, the decimal adjustment value for “Normal” may be set to either .1 or .025 via the Tuning Step Size menu.                     |
|                         | **To adjust frequency:**
|                         | ▶ Turn and press Headphone encoder.                                                                                                          |
| Block & Tx Switch       | Displays the block number and transmitter switch value.                                                                                      |
| Tuning                  | Displays current tuning group, such as Normal or Fine (for SRb). When adjusting frequency, values will be restricted to the selected tuning group. |
|                         | **To cycle through tuning groups:**
|                         | ▶ Slide RTN/FAV switch left.                                                                                                                  |
| Menu                    | Accesses the receiver’s model-specific settings, such as Compatibility mode and Tuning Step Size (for SRc).                             |
|                         | **To access receiver’s settings:**
|                         | ▶ Slide RTN/FAV switch right.                                                                                                                 |
The following example of the Receiver Details screen is for a Wisycom MCR42. Refer to Wisycom documentation for further explanation of these settings.

1. This section applies to Wisycom receivers, upgraded to SuperSlot, with firmware v3.5 or later. Wisycom receivers with earlier versions of firmware are treated as unislot receivers; therefore, the Receiver Details screen is not accessible.

### Screen Element Description

<table>
<thead>
<tr>
<th>Screen Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>Screen’s title displays the number of the receiver followed by the manufacturer and model name.</td>
</tr>
<tr>
<td>RF signal strength</td>
<td>Displays the strength of the RF signal.</td>
</tr>
<tr>
<td>Active antenna</td>
<td>Displays A or B to indicate which antenna is currently in use.</td>
</tr>
<tr>
<td>Transmitter battery level</td>
<td>Displays the level of the transmitter’s battery. The transmitter battery level is indicated by the color of the battery icon and the level of the bar. Green = over 50%, Yellow = over 20%, Orange = over 10%, Red = less than 10%. When the transmitter battery level information is not supported, the icon is black. This information is only provided when supported and supplied by the transmitter.</td>
</tr>
<tr>
<td>GR:</td>
<td>Displays the current group number of the receiver.</td>
</tr>
</tbody>
</table>

**To set the group number:**

- Turn and press Headphone encoder.
**RF Group Scan**

 Runs an RF scan of the current group for the Wisycom receiver.

**To run an RF group scan:**

- From the Wisycom Receiver Details screen, slide the MIC/TONE switch to the left.

The results of the scan will appear in a Select Group Frequency screen (shown below) from which a selected frequency may be assigned to one of the receiver’s channels.

<table>
<thead>
<tr>
<th>Screen Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RF Group Scan</td>
<td>Runs an RF scan of the current group for the Wisycom receiver.</td>
</tr>
<tr>
<td>Pre-fade level</td>
<td>Displays pre-fade audio level of the receiver’s output on the 688 input to which it is routed.</td>
</tr>
<tr>
<td>Frequency lock</td>
<td>Lock icon is visible for channels in which the frequency is locked. Frequency cannot be adjusted when locked.</td>
</tr>
<tr>
<td>CH:</td>
<td>The channel number of the receiver.</td>
</tr>
<tr>
<td>Menu</td>
<td>Accesses the receiver’s model-specific settings.</td>
</tr>
<tr>
<td>Frequency</td>
<td>Displays the frequency to which the receiver is currently tuned. Whole number and decimal number are adjusted independently. Decimal adjustments in .025 increments. Not adjustable when frequency is locked.</td>
</tr>
</tbody>
</table>

**To set the channel number:**

- Turn and press Headphone encoder.

**To access receiver’s settings:**

- Slide RTN/FAV switch right.

**To adjust frequency:**

- Turn and press Headphone encoder.

---

**Select Group Frequency**

Select Channel from Group 04 For Rx1:

<table>

Receiver Details Screen - Example C

The following example of the Receiver Details screen is for a Sennheiser EK6042. Refer to Sennheiser documentation for further explanation of these settings.

<table>
<thead>
<tr>
<th>SCREEN ELEMENT</th>
<th>DESCRIPTION</th>
</tr>
</thead>
<tbody>
<tr>
<td>Title</td>
<td>Screen’s title displays the number of the receiver followed by the manufacturer and model name.</td>
</tr>
<tr>
<td>RF signal strength</td>
<td>Displays the strength of the RF signal.</td>
</tr>
<tr>
<td>Active antenna</td>
<td>Displays A or B to indicate which antenna is currently in use.</td>
</tr>
</tbody>
</table>
| Transmitter battery level | Displays the level of the transmitter’s battery. The transmitter battery level is indicated by the color of the battery icon and the level of the bar. Green = over 50%, Yellow = over 20%, Orange = over 10%, Red = less than 10%. When the transmitter battery level information is not supported, the icon is black.  
  ① This information is only provided when supported and supplied by the transmitter. |
| Transmitter profile information | Displays information related to the preset transmitter profile compatible with the receiver.  
  ① See Sennheiser’s EK 6042 Instruction Manual for more information on transmitter profiles. |
| Pre-fade level       | Displays pre-fade audio level of the receiver’s output on the 688 input to which it is routed. |
| Menu                 | Accesses the receiver’s model-specific settings.                            |

To access receiver’s settings:
  ► Slide RTN/FAV switch right.
**Screen Element** | **Description**
--- | ---
Frequency | Displays the frequency to which the receiver is currently tuned. Whole number and decimal number are adjusted independently. Decimal adjustments in .025 increments. Frequency range varies and is dependent on the Transmitter Profile settings of the EK-6042.

**To adjust frequency:**
- Turn and press Headphone encoder.

---

### Scanning for Radio Frequencies

When the SL-6 is fitted with SuperSlot-compatible receivers, an RF Scan feature is enabled. Initiated from the Receiver Overview screen or a Receiver Details screen, the system scans the RF spectrum for RF signal activity and displays a visual image of the scan on the 688’s LCD, showing what frequencies within the scanned range are free of RF interference.

1. **When initiated from the Receiver Overview screen, the scan utilizes the SuperSlot receivers and draws the activity of the full range of the receivers. When initiated from a specific Receiver Details screen, the system utilizes that chosen receiver to run the scan, and will therefore be limited by the range of the receiver.**

From the scan, you may select a frequency and assign it to an available receiver channel.

**To initiate an RF scan and assign a frequency:**

1. Press HP + METERS to view the Receiver Overview screen.

![Receiver Overview Screen](image)

2. Slide the MIC/TONE switch to the left.

   The scan displays a graph showing signal activity of the RF spectrum from low to high frequency, with a white vertical line marking the cursor position, beneath which is displayed the selected frequency.
A scan can typically take a number of seconds. Although, with three slot-in receivers in the SL-6, the RF Scan’s triple-scan capability utilizes parallel processing to cut the time it takes to run the scan by one-third.

3. Do any of the following:
   - Turn the Select encoder to zoom in or out.
   - Turn the Headphone encoder to move the cursor and select a frequency.
   - Slide the MIC/TONE switch to the left to perform the scan again.

4. Press in the Headphone encoder to select a frequency. The Frequency Assign screen appears.

   As shown in the illustration, the text of receiver channels that are available for assignment appear white. Gray text indicates receivers that are outside the range of the chosen frequency, and gray hyphens (--) appear when the SL-6 slot is empty.

5. Use the Headphone encoder to select an available channel.
This section provides specifications for the SL-6 powering and wireless system, an optional accessory for the 688.

Features and specifications are subject to change. Visit the Sound Devices website for the latest product information.

### Powering

<table>
<thead>
